

The scientific basis of climate politics is wrong.

A greenhouse effect from greenhouse gases in the atmosphere has never been scientifically verified through observations. (*) There is no shortage of attempts, they have all been falsely explained. The work of the Swedish chemist Arrhenius also became so. He admitted it too!

So what is actually happening in the climate system?

Greenhouse gases in the atmosphere indisputably do not control global warming.

The atmosphere as a whole insulates, i.e. it controls the departure of energy, the cooling. The sun is responsible for the heating. This is fundamental!

The atmosphere does not heat up, it ensures that the energy is held so that it is not emitted as soon as it is received. No energy is created in the atmosphere.

Greenhouse gases are a small part of the atmosphere. They contribute to the process, which is a delayed cooling.. No heating! The climate gases actually contribute best to cooling!

Finally, I must reveal that human emissions of greenhouse gases amount to only about 4% of the total and constitute almost nothing of what builds up in the atmosphere. The claim that the increase in the atmosphere since pre-industrial times is due to man's use of fossil fuels is wrong!

Cuts in human emissions have no effect on the increase in the atmosphere.

The basis of climate politics is wrong.
