

Myths about weather and climate.

Extreme weather is a regional event, not global.

Extreme weather is climate variation, not climate change.

Extreme weather is not created by CO₂ in the atmosphere, but by energy from the sun.

Cutting human emissions of CO₂ does not prevent extreme weather.

Over the past 45 years, the global average temperature increased linearly by 0.015 degrees per year. This means that there has not been a change in global temperature for the worse or better these years.

The atmosphere insulates, i.e. delays the departure of energy. The energy moves from hot to cold, never the other way around. It can happen in three different ways, radiation (long-wave), conduction (touch) or convection (exploitation). No energy is created in the atmosphere.

Climate policy has been created and kept alive on myths, not scientific facts. The word for it is "Scam" in English. This, because scientific facts have been known all along from before the Climate Panel (1988) was established. (*)

*) Published in the IPCC report:

AR1: Scientific Assessment of Climate Change, Kapittel 8 «Detection of the Greenhouse Effect in the Observations» Side 245: «Previous reviews of the greenhouse problem (N R C 1983, MacCracken and Luther, 1985 Bolin et al 1986) have also addressed the detection issue They have concluded that the enhanced greenhouse effect has not yet been detected unequivocally in the observational record.»
